Working Edition B / research evolution

Analyst: Oladapo Olaniyan. AI-assisted continuation dated 2026-10-06. This is NOT a reconstructed Edition A and NOT a complete frozen Research-Evolution submission.

Edition A evidence hold: receipt 22599005, September 1 2026 2:30 PM. Unchanged local PDF hash F745E7EA27A1445830573029A77D28967A1E4F5E53A9BA9A794079373F35464F. Submitted bytes contain Edge File not found, not recoverable report content. Receipt-linked identity was established in the earlier audit; local hash was rechecked now. Original path: ../lab-03/Project_1_Edition_A_Baseline_PEP.pdf. Staff guidance unresolved; no contact. Neighboring notes and prior model outputs are not substituted for the baseline.

Item	Edition A	Working Edition B	Driver	Evidence
Recommendation	Unavailable	AI draft watch/defer; student judgment blank	AI analysis + current sources	Final-working-run output and conditional memo; not a claim of student change
Data/source	Unavailable	FY 2025 SEC consolidated base, Q 2 balance, Oct 5 prices/rate	Primary-source inspection	Source-register-v 3; price/as-of reconciliation
Model design	Unavailable	Five-year linked statements; FCFF/WACC; funded terminal reinvestment	Course requirement + AI coding	Lab 10 FCFE audit; 42 ordinary checks and cold-run evidence
Risk	Unavailable	Terminal dependence; incomplete bridge/peer definitions; stub approximation	Source reconciliation + model output	Working-capital difference 802; explicit limitations

Observable continuation evolution, not A-to-B claims: Lab 10 mechanics were rebuilt on FCFF/WACC rather than renamed; Lab 11 unsupported company stress values were rejected. The first executed working model used terminalFCFF growth mechanically; a subsequent version used NOPAT*g/ROIC reinvestment, changing base value from 130.67 to 117.29. Both output directories are preserved. This records a consequential AI-assisted design correction, not a personal experience or recovered baseline.

AI-output check: an earlier AI implication that cash-flow capital spending and segment capital spending might mismatch was corrected. SEC FY 2025 cash-flow capital spending 4,415 and Note 1 total capital spending including corporate 4,415 agree. The numerical primary-source comparison is independently recorded in checks.csv. Agreement between AI outputs would not establish validation.

Current supporting check: all 20 forecast scenario-year rows articulate balance sheets/cash flows and the FCFF financing reconciliation. Highest-risk cash-ledger corruption detection and known-answer fixture tests are separate ordinary validation, not locked evidence.

Student's final position, supporting interpretation, acceptance/rejection of AI recommendations and “what changed from Edition A to Edition B, and why”: [blank - student input and staff guidance required; A unavailable].

Do not combine the malformed original into a report that represents recovered content. After guidance, preserve unchanged Edition A evidence and any authorized dated explanatory addendum; content-equivalent repository/Brightspace copies must be frozen consistently.

Source correction within this AI-assisted continuation: the 4,415 capital-spending total is Note 1 (including corporate), not Note 15. Segment subtotal 4,192 + corporate 223 is now a separate executable primary-source reconciliation. Earlier drafts are superseded and preserved; no student judgment is asserted.
