Validation and AI use

Oladapo Olaniyan | FIN-43900 Project 1 | October 17, 2026

Evidence boundary

Market reference: October 5, 2026. Annual accounts: FY2025 ended December 27, 2025. Interim balance: June 13, 2026; point shares: July 2. USD millions and shares millions except per-share values and decimal rates. Source retrieval and accounting definitions are recorded in source-register-v3.csv and data/filing-inputs.json. No complete post-quarter cash/debt/share rollforward or new current market quote is claimed.

Executed checks

Area	Evidence / result	Limit
Ordinary suite	42 PASS; 0 FAIL; 5 OPEN; 2 QUALIFIED	PASS applies to named checks, not all economics
Known answer	Twelve published synthetic metrics reconciled	Mechanical reference case, not company forecast proof
Source/definition	Capex 4,192 + 223 = 4,415; filing statement arithmetic and cash distinctions	Working-capital scope difference $802M remains qualified
Forecast articulation	Twenty scenario-year rows; statement/cash reconciliation	Simplified frozen accounts and funding assumptions disclosed
FCFF / bridge	Financing reconciliation; independent Decimal bridge	Book proxies and stale balance/share dates remain
DCF	Boundary rejection, monotonicity, terminal reinvestment, reverse residual	Stub timing and economic assumptions not established
Failure / downside	Deliberate copied-cash corruption detected; named downside propagated	Not a default/covenant forecast
Clean rerun	Exit 0, no stderr, five principal output hashes match	Historical log paths predate folder move

Evidence: outputs/final-working-run/checks.csv and repro/cold-20261006T053603935700Z/cold-run-evidence.json. Open and qualified rows remain in the deliverable output. An older static row about a blank locked record predates the dedicated test below; it is not the test's result.

Locked changed-input record

Field	Recorded evidence
Input and units	Annual terminal incremental ROIC; 15.0% to 12.0%
Frozen prediction	Lower ROIC increases reinvestment for fixed growth, lowers terminal FCFF/value; watch/defer expected to remain
Precommit	October 15, 2026, 5:22 PM CDT; separately frozen baseline and snapshot hashes
Run	Separate experiment copy; exit 0; only the terminal_roic assumption changed
Before / after	Reinvestment $2,270.1M to $2,837.6M; terminal FCFF $11,350.3M to $10,782.8M; EV $200,935.6M to $192,886.3M
Value / direction	$117.29 to $111.41; decline $5.88 / 5.02% using unrounded values; predicted direction matched
Decision effect	Both values below $125.65; fixed draft watch/defer label unchanged; no numeric decision threshold is tested
Evidence	repro/locked-change-20261015T1722CDT/locked-test-report.md and frozen-baseline / experiment-run folders

The prediction and test were AI-assisted. Oladapo reports the professor clarified in class that the posted no-AI wording was a typo and encouraged AI use. The original posted wording remains preserved; no written amendment is invented. This test checks one input's propagation, not that 12% or 15% is the right economic ROIC.

Material AI uses and dispositions

Exposed assistant identity: Codex / GPT-6. A finer build identifier is unavailable. Material interactions occurred October 6, 15 and 17, 2026. Browser/source retrieval, local Python calculation, ReportLab PDF preparation, and local faster-whisper small.en transcription comparison were used.

AI-assisted task	Check and disposition
Requirements and lab audit	Compared with Brightspace, source files and receipt; use traceable findings; recorded TA resolution supplements old status
Source ledger and normalization	Separate filing arithmetic and locators; normalization economics remain qualified
Linked forecast / FCFF / WACC code	Known answers, statement/cash identities, bridge and boundaries; computational checks pass, assumption risks retained
Terminal reinvestment design	Explicit g/ROIC funding replaces mechanical growth; terminal ROIC remains assumed
Forecast/scenario/peer inputs	Labeled assumptions and qualified comparisons; not represented as observed future facts
Capex mismatch implication	Corrected against primary arithmetic: $4.192B + $0.223B = $4.415B
Changed-input prediction and run	AI assistance disclosed; frozen copy and one-variable comparison retained
Memo, research and recording scripts	Prepared with AI; watch/defer position independently expressed by Oladapo in the recordings; no blanket assumption attestation inferred
Transcripts and timing	Supplied speech drafts compared with full local recognition; topic times corrected; harmless filler may be condensed, uncertain phrases noted separately

Failures, qualifications and recording evidence

The original inherited Python environment could not launch; the recorded clean run used a fresh no-pip environment. SEC direct retrieval returned 403; inspected source text and retrieval failures remain documented. Initial terminal mechanics were corrected; original outputs are preserved. The working-capital difference, current bridge, book/fair-value/lease claims, peer comparability, depreciation convention, stub timing and forecast assumptions remain limitations. No real fresh-eyes partner challenge is asserted without evidence.

Video 1 contains dated working pages; the recorded TA clarification and executed checks supersede their unresolved/not-run wording. The original receipt-linked PDF and supporting draft are preserved with provenance limits. Video 3 speaks to sensitivity, reverse DCF and peers, but sampled frames show summary tables; the manifest does not claim the detailed sections were visually expanded.

Videos measure 2:16.405, 4:08.768 and 4:41.240, within 3/5/5-minute limits. Screen samples show webcam and project evidence. Transcript topic times are approximate navigation markers, not word-level caption timings. ROIC terminology and the 5.02% computation are explained in separate editorial notes, with spoken claims preserved. The comparison is automated and not represented as human word-for-word certification.

Source scripts, immutable test evidence, ordinary output, original logs, recording metadata, reported guidance and clarifications accompany this package. Hosted links and instructional-team access must be completed in the manifest; missing external access is not resolved by preparing these documents.
